

QUALITY MANAGEMENT SYSTEM

The adoption of HCH quality management system is a strategic decision of HCH organization structure. It is specially designed for HCH particular products-bearings and the relative processes employed. The chart below shows HCH basic model of a process-based quality management system. HCH quality management system illustration below shows customers play a significant role in defining requirements as inputs. Monitoring customer satisfaction requires the evaluation of information to related with customer perception as whether the organization has met the customer's requirements.

● Model of a process-based quality management system

The Quality Management System also serves the employees of HCH in applying its quality policy and pursuing the consistent achievement of quality and strategic goals. From order entry to design, manufacturing and servicing, activities are controlled in accordance with the commitments of the QMS.

Performance Test Results:

Dimensional Results: HCH will submit dimensional results for parts produced from the production trial run. Actual results shall be recorded against all dimensions, characteristics and specifications as required / specified in the approved M&M part drawings.

Noise & Vibration Level: Factors that attempt to disrupt intended function of the system/subsystem/component (ie: piece-to-piece variation, changes over time, customer usage and duty cycle, environment, system interaction, etc.)

Appearance Results:

| GREASE | BRAND | | | | | | | | | | | | |
| TESTING METHOD | ALL TESTED | INSPECTOR | Zhangyanfei | DATE | 2013.1.17 | | | | | | | | |

Note: 1. All tests required / conducted and related specifications should be listed along with quantity tested and the actual results of each test.
 2. The report should be on letterhead of the laboratory. The date should be indicated on which the testing took place.

Initial Process Studies / Process Capability Plan:

Significant & Critical Features are part characteristics that significantly affect performance, fit, function or workability on the completed units, and therefore require application of statistical measures for capability assessment and control. The purpose of such studies is to gain confidence in the production process with potential to produce products that will meet the customer requirements and result in customer satisfaction.

| | Short Term CPK | Long Term PPK |
|---------------------------|---|--|
| Sample Size | 100 (30 minimum) | ≥ 50 or as required to determine variability source |
| Expectation Variable Data | ≥ 1.67 , Stable | ≥ 1.33 , Stable |
| If expectation is not met | 1. Process control method is required (ie: increased audit, SPC, 100% inspection, etc.) 2. Inspect 100% since the last in-control point and implement corrective action. 3. Notify if parts escaped and begin containment activity. | |

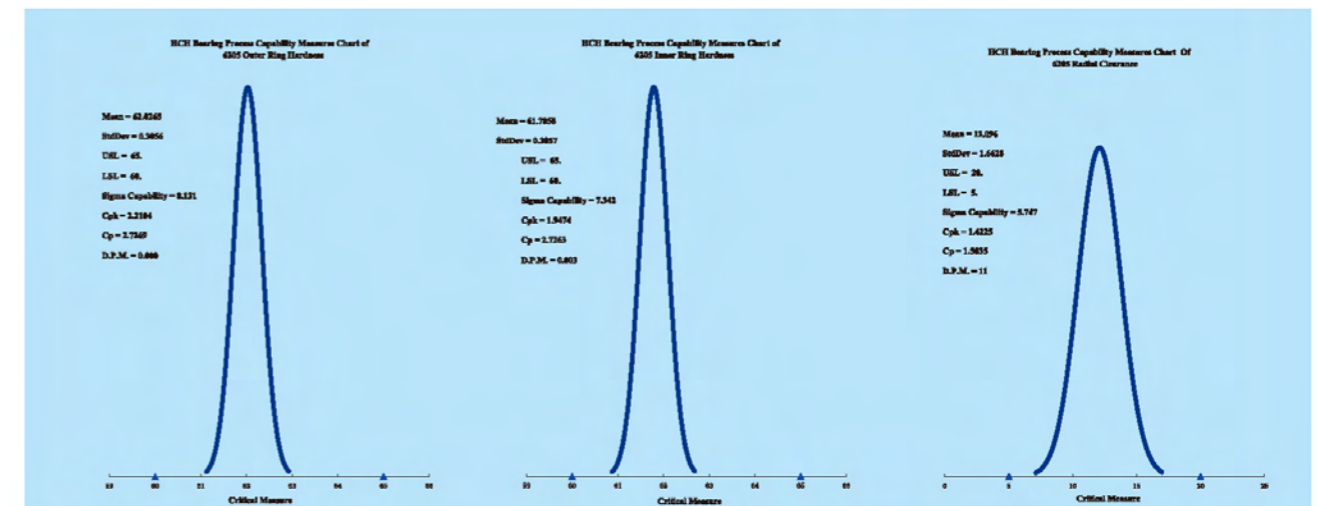

The Ppk study should be based on 100 (minimum 30) consecutively. For all Significant and Critical characteristics, the concerned processes should be stable and under statistical control with preliminary process capability index (PPK) above 1.67 in production trial run & on-going process capability index (CPK) above 1.33 in regular production.

CPK of Inner Bore Diameter Ellipse for HCH P/N: 6205

Inspected: 125 Pcs STD Size: $\phi 25 \times \phi 52 \times 15$
 ISO Grade: ABEC-1 (0~-10um) Insp. Sub: Inner Bore Diameter Ellipse
 Analyst: RongGuoXiang Approved by: LuGuoCan

Unit: um

Reliability Test Results:

For ongoing production, reliability checks are to be conducted on a defined frequency.

The common measurement is “ L_{10} ” life, defined as the number of revolutions before metal fatigue first appears on 10% of a large group of like bearings. This is referred as basic rating life of fatigue life. The relationship between the basic rating life, the basic dynamic load rating and the bearing load is given in following formula:

$$L_{10} = \left(\frac{C_r}{P}\right)^p$$

where,
 $p = 3$ for ball bearings
 $p = 10/3$ for roller bearings
 L_{10} : Basic rating life (at 90% reliability), millions of revolutions
 C_r : Basic dynamic load rating, N or kgf
 P : Equivalent dynamic load, N or kgf

$$L_{10h} = \frac{10^6}{60n} \left(\frac{C_r}{P}\right)^p$$

where,
 n : Rotational speed, rpm

Internal Audits

HCH is strengthening its group audit functions as a mean of reinforcing its manufacturing. To guarantee the quality management is effectively implemented and maintained, HCH conducts internal audits at planned intervals to determine whether the quality management system conforms to the planned arrangements, the requirements of International standard and what established by HCH. The Scope of Internal Audit:

1. Review of requirements related to the product: Product requirements are defined. Reviewing the order and contract requirements and resolving the detailed problem to ensure HCH bearings meet specific requirements.
2. Quality management system audit: HCH Internal Audit department audits its quality management system to verify compliance with technical specification and any additional quality management system requirements, also audit each manufacturing to determine its effectiveness.
3. The department should audit products at appropriate stages of production and delivery to verify conformity to all specified requirements, such as product dimensions, functionality, packaging and labeling, at a defined frequency.
4. Continuous Improvement: Evidence demonstrates the use of data (ie: First Pass Yield, Final Test, In-process Cpk, etc.), past experience, and lessons learned may be requested to show continuous improvement of quality management system.

| SHOPFLOOR AUDIT Receiving Inspection, Manufacturing Operation, Post-Process (as applicable), Packaging, Shipping | | |
|--|--------------------|----------------------------------|
| PREPARATION FOR AUDIT (Documents Required) | Available (Yes/No) | Dates and Revisions of Documents |
| 1) Are receiving inspection instructions available and accurate, as appropriate? | | |
| 2) As defined in the Control Plan, is appropriate sample size and frequency maintained at receiving inspection? | | |
| 3) Are control plan inspections and process steps covered in the manufacturing/work instructions? | | |
| 4) Are manufacturing instructions approved according to the plant's procedures? | | |
| 5) Are manufacturing instructions readily available to the operators? | | |
| 6) Do the operators follow the manufacturing instructions for the station they are running? | | |
| 7) Do manufacturing instructions tell the operator what to do when they find a non-conforming part? | | |
| 8) Is non-conforming product properly controlled? | | |
| 9) Is there an approved rework instruction for any rework/repair being performed? | | |
| 10) Do operators follow written rework instructions? Are parts re-inspected after rework. | | |
| 11) Are Process or Quality Alerts, as appropriate, being followed? Are the Alerts readily available to the operator? | | |
| 12) Are in process and/or Lot Acceptance Tests being conducted at their specified frequencies? | | |

| Mistake Proofing and Gages | | |
|---|--------------------|----------------------------------|
| PREPARATION FOR AUDIT (Documents Required) | Available (Yes/No) | Dates and Revisions of Documents |
| 1) Are inspection results documented and retrievable ? | | |
| 2) Is mistake proofing verified at the start of every shift? | | |
| 3) Is mistake proofing verified at the start of every shift? | | |
| 4) Are all gages updated to the corresponding approved product release level? Do all gages comply with the approved Gage Control Drawing/Specification? | | |
| 5) Are gages being used according to instructions? | | |
| 6) Are all gage calibrations current? | | |
| Statistical Process Control | | |
| 1) Are statistical controls used as required in the control plan? Is their evidence to show that someone is reviewing and reacting to the data? | | |
| 2) When an out-of-control or out-of-spec condition is found, is there documentation indicating the actions taken to correct the situation or contain the issue? | | |
| 3) Is process stability at or above Cpk targets for critical and significant characteristics or are plans documented to reduce variation? | | |
| 4) Are continuous improvement action plans available and being implemented? | | |
| Identification, Traceability, Packaging, Maintenance, Training, Cleanliness, Safety | | |
| 1) Are product builds traceable as identified in the Control Plan? | | |
| 2) Does packaging and labeling meet customer specifications? | | |
| 3) Is preventive maintenance / PM for the line being performed to schedule? | | |
| 4) Are operators trained prior to operating a station, and is documented evidence readily available? | | |
| 5) Is tagging of material required? If so, is material tagged per the plant procedures? | | |
| 6) Are the premises maintained in a state of order, cleanliness, and repair? Are 5S principles adopted? Is Personal Protective Equipment available and worn according to Factory rules? | | |
| Non-Conforming Product, Corrective Action and Lessons Learned | | |
| 1) For past corrective actions; are the improvement actions still required, effective, and maintained? | | |
| 2) Are the findings from DOCK AUDITS resolved in a timely manner? | | |
